

In the Claims

Please amend the claims as follows:

1. (Previously Presented) A chair comprising:

a chair frame, said chair frame comprises a fixed frame having a fixed plate, and a movable frame hingedly connected to the fixed frame and having an actuating plate;

a seat-back member mounted on the chair frame, said seat-back member comprises a seat part and a backrest part which are integrally formed with each other, and which is adapted to be tilted rearwardly and restored to its normal position; and

a lumbar support unit attached to a lower portion of the backrest part, which is automatically protruded forwardly when the seat-back member is tilted rearwardly, and is resiliently restored to its normal position when the seat-back member is erected, said lumbar support unit comprises

a lumbar plate which is hingedly connected at one end to the backrest part and is connected at the other end to the backrest part to be slid up and down, and which is adapted to be protruded forwardly; and

an actuating connector which is connected at one end to the lumbar plate and is connected at the other end to the chair frame such that the actuating connector causes the lumbar plate to be protruded forwardly when the seat-back member is tilted rearwardly and is resiliently restored to its normal position when the seat-back member is erected, wherein said actuating connector comprises

a connecting wire which is connected at one end to an upper end of the lumbar plate and is connected at the other end to the fixed plate of the fixed frame; and

Serial No.: 10/076,847

2

a connecting tube into which the connecting wire is extended, and which is connected at one end to the backrest part such that the one end of the connecting tube is positioned at a location downwardly spaced from the one end of the connecting wire, and is connected at the other end to the actuating plate of the movable frame, wherein the one end of the connecting wire, which is connected to the lumbar plate, is exposed from the one end of the connecting tube by a certain distance in its normal position, and the exposed distance of the connecting wire is equal to or longer than a distance by which the actuating plate moves downwardly.

2. (Cancelled)

3. (Cancelled)

4. (Cancelled)

5. (Withdrawn) The chair as set forth in claim 2, in which the chair frame comprises a fixed frame having a fixed plate, and a movable frame hingedly connected to the fixed frame and having an actuating plate, and the actuating connector comprises:

a connecting wire which is connected at one end to a lower end of the lumbar plate and is connected at the other end to the fixed plate of the fixed frame; and

a connecting tube into which the connecting wire is extended, and which is connected at one end to the backrest part such that the one end of the connecting tube is positioned at a

Serial No.: 10/076,847

3

location upwardly spaced from the one end of the connecting wire, and is connected at the other end to the actuating plate of the movable frame.

6. (Previously Presented) The chair as set forth in claim 1, in which the lumbar support is provided at its upper end with an angled bracket extended toward the backrest part and supporting a shaft, both ends of which are provided with rollers moving up and down for the sake of smooth motion of the lumbar plate, and the backrest plate is provided a rail plate at a position corresponding to the lumbar support unit, the rail plate being provided at its both sides with guide rails extended downwardly, the rollers being slid up and down along the guide rails of the rail plate.

7. (Previously Presented) The chair as set forth in claim 1, in which the connecting wire is provided at one or both ends with wire control means for controlling lengths of the connecting wire exposed from the ends of the connecting tubes.

8. (Original) The chair as set forth in claim 7, in which the wire control means comprises a bolt integrally coupled to the end of the connecting wire, and a fastening nut disposed on the fixed plate and threaded with the male threaded portion of the connecting wire to control the exposed length of the connecting wire by its own rotation.

9. (Previously Presented) The chair as set forth in claim 1, in which one or both ends of a connecting tube of the actuating connector are formed at outer surfaces thereof with male threaded portions, and each of the threaded portion of the connecting tube is threaded into two nuts for fastening the male threaded portion.

Serial No.: 10/076,847

4

10. (Withdrawn) A chair comprising:

- a fixed frame;
- a movable frame coupled to the fixed frame to be tilted rearwardly;
- a seat part attached to the fixed frame;
- a backrest part attached to the movable frame;
- a lumbar support unit attached to a lower portion of the backrest part, which is automatically protruded forwardly when the backrest part is tilted rearwardly, and is resiliently restored to its normal position when the backrest part is erected.

11. (Withdrawn) The chair as set forth in claim 10, in which the lumbar support unit comprises:

- a flexible lumbar plate connected to a lower part of the backrest part; and
- an actuating connector which is connected at one end to an upper end of the lumbar plate and connected at the other end to the fixed frame;

whereby the lumbar plate is protruded forwardly and restored to its normal position by displacement of the movable frame with respect to the fixed frame when the backrest part is tilted and restored.

12. (Withdrawn) The chair as set forth in claim 11, in which the actuating connector comprises:

- a connecting wire which is connected at one end to an upper end of the lumbar plate and is connected at the other end to the fixed plate of the fixed frame; and

a connecting tube into which the connecting wire is extended, and which is connected at one end to the backrest part such that the one end of the connecting tube is positioned at a location downwardly spaced from the one end of the connecting wire, and is connected at the other end to the movable frame or the movable frame.

Serial No.: 10/076,847

5

13. (Withdrawn) The chair as set forth in claim 11, in which the actuating connector comprises only a connecting wire, which is connected at one end to an upper end of the lumbar plate and is connected at the other end to the fixed frame.

14. (Withdrawn) The chair as set forth in claim 11, in which the actuating connector comprises: a connecting wire which is connected at one end to an upper end of the lumbar plate and is connected at the other end to the fixed frame; and

a connecting tube into which the connecting wire is extended, and which is connected at one end to the backrest part such that the one end of the connecting tube is positioned at a location upwardly spaced from the one end of the connecting wire, and is connected at the other end to the movable frame or the movable frame.

15. (Withdrawn) The chair as set forth in claim 11, in which the lumbar support is provided at its upper end with an angled bracket extended toward the backrest part and supporting a shaft, both ends of which are provided with rollers moving up and down for the sake of smooth motion of the lumbar plate, and the backrest plate is provided a rail plate at a position corresponding to the lumbar support unit, the rail plate being provided at its both sides with guide rails extended downwardly, the rollers being slid up and down along the guide rails of the rail plate.

16. (Withdrawn) The chair as set forth in claim 12, in which the connecting wire is provided at one end with wire control means for controlling lengths of the connecting wire exposed from the ends of the connecting tube.

Serial No.: 10/076,847

6

17. (Withdrawn) The chair as set forth in claim 16, in which the wire control means comprises a bolt integrally coupled to the end of the connecting wire, and a fastening nut disposed on the fixed plate and threaded with the male threaded portion of the connecting wire to control the exposed length of the connecting wire by its own rotation.

18. (Withdrawn) The chair as set forth in claim 14, in which the end of the connecting tube of the actuating connector is formed at outer surfaces thereof with a male threaded portion, and the threaded portion of the connecting tube is threaded into two nuts for fastening the male threaded portion.

19. (Previously Presented) The chair as set forth in claims 1, in which one or both ends of the connecting tube of the actuating connector are formed at outer surfaces thereof with male threaded portions, and each of the threaded portion of the connecting tube is threaded into two nuts for fastening the male threaded portion.

20. (Withdrawn) The chair as set forth in claim 13, in which the connecting wire is provided at one end with wire control means for controlling lengths of the connecting wire exposed from the ends of the connecting tube.

21. (Previously Presented) The chair as set forth in claim 1, wherein said lumbar support unit is automatically protruded forwardly only when the seat-back member is tilted rearwardly, and is resiliently restored to its normal position only when the seat-back member is erected.

22. (Cancelled)
